[A] Possible reduction in registered seats. [B] The technically permissible towable mass of the motor vehicle is a piece of information associated with the type approval of the completed vehicle. Based on the towbar that will be mounted on the vehicle and specific values given by the manufacturer of the towbar and the tow ball, the maximum trailer mass that the vehicle can pull may be less. The characteristics of towbar and tow ball resistance (in particular values D and S) are engraved on a plate fixed on it. Value D allows to calculate the maximum permissible mass for the towbar (MPM) with the following calculation:  $MPM = (D \times T \times 1000) / ((T \times 9.81) - (1000 \times D))$ , with T = maximum vehicle mass (GVW) (in kg) and D = value (in kN) indicated on the towbar. The maximum trailer mass (in kg) is thus less than or equal to the MPM for a maximum towable mass of the vehicle that may be up to 2000 kg.

All data (weight / measures) are indicated with a tolerance of 5%.

FIAT chassis: definition of the carriers different from the original commercial definitions of the chassis manufacturers. Unladen weight: the value shown in the catalogue based on a manual gearbox and entry level engines with no towing capability. Any accessories installed optionally or by the distributor are not included in the definition of the vehicle's unladen weight. The weight of these elements must therefore be deducted from the vehicle's payload.
